

Widget Delivery Program Strategy – **Dashattan & Doorlanta**

A Dasher Selection, Satchel Distribution, and Success Measurement Strategy

Objective

Launch a scalable widget delivery operation across two market types using:

- *High-performing Dashers*
- *Specialized satchel infrastructure*
- *City-specific operating models*
- *Data-backed eligibility rules*

Core Problem

Widgets create higher operational risk than standard food delivery because they are:

- *High-value*
- *Temperature-sensitive*
- *Larger than standard orders*
- *More damage-prone during transport*
- *Unlike food delivery, widget success depends heavily on selecting the right Dashers.*

Recommendation

Launch through a controlled pilot using only the top-performing 20–25% of Dashers. Analysis of 54 Dashers shows strong performance gaps between average and elite Dashers. The data proves widget delivery should operate as a premium tier rather than a marketplace-wide rollout.

Marketplace Performance Overview

Key Operational Metrics from Delivery Dataset

Volume & Marketplace Size

Delivery Performance

Risk & Marketplace Health

- Fraud Rate (0.75%)
- Batch Rate (13.03%)
- Avg Items/Order 3.3
- Avg Composite Score 4.2
- Max Composite Score 34.53
- Median Composite Score 4.5
- Min Composite Score 0.53
- Deliveries with On-Time Data 770

Dasher Quality Distribution

Goal: identify operational traits linked to delivery success

Key Marketplace Insight #1

On-Time Delivery Performance Is Weak

- Average On-Time Rate = 22.16% from historical data and from 1200 delivery details
- Only 770 deliveries had valid timing records

Strategic Implication

Widget delivery should not use the full Dasher marketplace.

Only Dashers with strong operational consistency should qualify. And rather than 21.75% early delivery we should focus on not making 26.67% late delivery

Key Marketplace Insight #2

Delivery Speed Is The Strongest Predictor Of Success

Metric	Relationship to Success
Performance Score	Very Strong
On-Time Rate	Strong
Speed Score	Strong
Delivery Time	Strong Negative
Ratings Alone	Weak Predictor

Critical Finding

- High ratings do NOT guarantee strong delivery performance.
- Operational speed and reliability matter more.

Key Marketplace Insight #3

Long Pickup Time Drives Poor Performance

Strongest negative operational drivers:

- Long confirm-to-deliver cycle
- High Dasher-to-restaurant travel time
- Long waiting time at pickup

Dataset Finding

Dashers with:

- Delivery cycles under ~33 minutes
 - Wait times below ~10 minutes
- consistently ranked highest.

Data-Validated Dasher Selection Model

Analysis of all 54 Dashers shows performance varies dramatically.

Top-ranked Dashers outperform average Dashers across:

- Speed
- Timing reliability
- Execution consistency

Final Selection Framework

Weighted Model

Final Widget Eligibility Score =

40% Profile Quality + 60% Operational Performance

Profile Quality (40%)

Measures long-term reliability.

Includes:

- Total deliveries
- Five-star history
- Composite score
- Experience level

Operational Performance (60%)

Measures real execution.

Includes:

- On-time rate
- Delivery duration
- Wait-time efficiency
- Route completion quality

Profile Rank	Dasher	Current Performance Rank
1	Cate	34
2	Lauran	45
3	KC	10
4	Jagar	29
5	Hanna	36
6	Merissa	37
7	Matt	49
8	Katelynn	24
9	Brian	2
10	Ron	28

Metric	Top Dashers
Delivery Time	28–33 min
Wait Time	3–10 min
On-Time Rate	33–100%
Rating	4.6–5.0

Key Finding

Speed consistency predicts success more than historical volume.

Exact Qualification Rules

Dashers qualify only if:

- Top 25% Rank
- Performance Score ≥ 0.55
- Delivery Time ≤ 35 min
- Wait Time ≤ 10 min
- On-Time Rate $\geq 30\%$
- Avg Rating ≥ 4.6
- Minimum 20 completed deliveries

Market-Specific Dasher Strategy

The two cities require different operational priorities.

Dashattan (Dense Urban)

Data Signals

Average Metrics:

- Delivery Time = 41.1 min
- Higher congestion exposure
- More bicycle Dashers

Operational Challenge

- Urban congestion creates unpredictable timing variability.

Best Performing Fleet Type

Top Dashattan performers are primarily:

- Bicycle Dashers
- Short-route specialists
- Recommendation

Optimize for:

- Fast pickup
- Route agility
- Short-distance completion

Dataset Proof

Top 25% Dasher Breakdown:

Market	Dominant Vehicle
Dashattan	Bicycle
Doorlanta	Car

Dashattan and Doorlanta

	AVG_COMPOS	TOTAL_DELIVE	NUM_FIVE_STA	AVG_DASHER	AVG_RESTAUR	AVG_RATING	Number of ratings
AVG_COMPOS	1	0.11	0.11	0.19	-0.16	0.18	0.05
TOTAL_DELIVE	0.11	1	0.99	0.15	-0.13	0.12	0.63
NUM_FIVE_STA	0.11	0.99	1	0.13	-0.14	0.12	0.66
AVG_DASHER	0.19	0.15	0.13	1	-0.4	-0.03	0.11
AVG_RESTAUR	-0.16	-0.13	-0.14	-0.4	1	-0.4	-0.21
AVG_RATING	0.18	0.12	0.12	-0.03	-0.4	1	0.19
Number of ratings	0.05	0.63	0.66	0.11	-0.21	0.19	1

Doorlanta (Large Suburban)

Data Signals

Average Metrics:

- Delivery Time = 39.1 min
- Larger delivery zones
- Higher dependence on cars

Operational Challenge

- Long travel distance increases delivery failure risk.

Best Performing Fleet Type

Top Doorlanta performers are primarily:

- Car-based Dashers
- Reliability-focused Dashers
- Recommendation

Optimize for:

- Route consistency
- Delivery completion reliability
- Vehicle-based transport

Fleet strategy should adapt to city structure rather than use one standard model.

Widget Satchel Distribution Strategy

Problem

Widgets require insulated, protective satchels. Dashers do not currently own this equipment.

Without equipment control:

- Damage increases
- Temperature loss increases
- Delivery quality becomes inconsistent

Dashattan Distribution Model

Centralized Hub Distribution

Why:

- Dense city geography
- Easier replenishment
- Faster turnaround

Model

- Dashers pick up satchel from local hub
- Daily swap available
- Damaged satchels replaced quickly

Operational Benefit

- Lower inventory cost
- Faster reuse cycle
- Better quality control

Doorlanta Distribution Model

Decentralized Shipment Model

Why:

- Large geographic spread
- Higher travel burden

Model

- Approved Dashers receive assigned satchel
- Equipment tied to Dasher ID
- Replacement via shipment

Operational Benefit

- Less travel friction
- Better suburban scalability

Equipment Governance

Assign satchels only to:

- Certified Dashers
- Top-ranked performers
- Pilot-approved users

Track:

- Satchel ID
- Usage frequency
- Damage rate
- Delivery quality
- Return compliance

Success Metrics & Strategic Recommendation

Widget-Specific KPI Framework

Customer Metrics

- Widget-specific rating
- Complaint rate
- Temperature satisfaction
- Damage incidence

Operational Metrics

- On-time widget delivery %
- Failed delivery rate
- Satchel utilization rate
- Delivery duration
- Return/replacement frequency

Business Metrics

- Widget order adoption
- Revenue contribution
- Pilot profitability
- Dasher retention

Final Strategic Conclusion

Full dataset analysis proves:

- Not all Dashers are suitable for widget delivery
- Speed + reliability drive success more than ratings alone
- Market-specific fleet design improves performance
- Equipment control is required for quality assurance

Widget delivery should operate as a premium logistics layer rather than a standard marketplace extension.

Recommended Rollout

Phase 1

Controlled Pilot
Top 20–25% Dashers only
Satchel-certified fleet
Limited geographic testing

Phase 2

KPI Monitoring Track:
Delivery damage reduction
Timing reliability
Customer satisfaction

Phase 3

Scale Expansion
Expand only if widget KPIs
outperform standard delivery
benchmarks.
